

Royal Rife and the road not travelled

Invention, innovation, and the simillimum

by Jerome Whitney

Jerome became involved in homeopathy as a student of Dr Thomas Maughan. He remains continuously active in the promotion and education of homeopathy. His teaching and writings focus on the healing principles from which it has evolved, their expression in the present, and ways to bring scientific and practice advances into being for the future. He is also on the editorial team of *Homeopathy in Practice* where many of his articles have been published.

As well as being an on-going participant in meditative provings, Jerome is also currently creating and leading a home schooling course titled 'Explorations in conceptual thinking'. His enjoyment for hiking and biking continues when the sun shines.

For 85 years the road carved out by innovative pioneers such as Royal Rife and Jacques Benveniste has been blocked by multinational interests benefiting from the profits derived from chemical and drug-based medical treatments. Rife's approach to electromagnetic detection and treatment of disease as well as the implications of Benveniste's application of the memory of water to serial dilution of medicines have been repeatedly mocked and trivialised by the 'scientific' community. This, despite tangible results produced by both during their tireless research extending over many years.

Rife's became the road not travelled

Now, however, there is hope: Luc Montagnier, Nobel prize winning scientist and co-discoverer of the Aids virus, has taken forward research on the memory of water. In so doing he has not only validated the Benveniste findings but is also travelling on a route regarding the electromagnetic properties of blood plasma similar to Rife's electromagnetic discoveries. In so doing the road not travelled is once again being thrust open by a determined pioneer who is fully aware of the worldwide opposition from the 'church' of modern science and vested interests that are now attempting to trivialise him. To learn more of the contemporary work of Montagnier please refer to the Summer / Autumn 2014 issue of *Homeopathy in Practice*, pp 16-27.

Those who rejected Rife's observations had microscopes of only 2500 power magnification and thus were unable to see what Rife had witnessed

Meanwhile let us step back and explore the contributions of Royal Rife, as well as the opposition that closed the road he had opened.

Had Royal Raymond Rife (1888 – 1971) limited himself to the invention of the most powerful optical microscope ever constructed, he would have gone down in history as:

- A genius in the manipulation of optics
- The inventor-designer of an optical-based microscope of 60,000 magnifications, a micro dissector, and a micro manipulator
- The first to observe living cancerous bacteria under a microscope
- The proponent of cancerous cells as having 'pleomorphic' ➤

- properties i.e. the ability to change shape or form
- The discovery that under ultra high magnification living disease cells are observed to radiate a unique colour; this phenomenon occurs when subjected to refracted light, without them having been stained. It results in an emission of radiation unique to those particular cells of a specific frequency of the electromagnetic spectrum. (Listen to Rife in his own words in the last quarter of the following youtube page: <http://www.youtube.com/watch?v=AysfKyl8O9k&list=PL95CF2B080271A994&index=2>)
 - NB: this phenomenon could not be observed with the electron microscope that came into use in 1939, as its samples were held in a vacuum and bombarded with electrons killing the specimen sample.

However, he did not stop there but went on to:

- Utilise pulsed radiation modulated by radio frequencies, rather than chemicals, to target and bombard disease cells to a level of energy that overstimulated them to annihilation.
- The above was accomplished by matching the natural output frequency of the cell with an overpowering high voltage pulse of the same frequency.
- This resulted in a targeted approach that did not affect surrounding healthy cells.
- By 1932 Rife had destroyed the typhus bacteria, poliovirus, herpes virus, cancer virus and other viruses in cultures and experimental animals.
- In 1934, in conjunction with a prestigious group of nationally famous doctors, 16 terminally ill people were treated. 14 experienced remission in three months and the remaining two in six months.

Yet by 1938:

- A lab supporting Rife's research was burnt to the ground.
- The American Medical Association (AMA) brings Rife to trial.
- Doctors who continue to use the Rife frequency generating instruments and technique lose their licences to practise.

Subsequently over the years: Rife equipment was impounded and destroyed.

- The AMA actively prevented

peer-reviewed journals from publishing any mention of the Rife accomplishments.

- Even a number of the doctors who appeared in photographs with Rife denied knowing him.
- There is no mention of the Rife microscope in any history of the evolution of optical microscopes.

An extended discussion of the deliberate dismantling of Rife's reputation and the near success in turning him into a non-person may be readily found elsewhere on the web or read in the time line summary on: <http://educateyourself.org/cn/rifetimelinemay1998.shtml>.

Homeopaths over the past 200 years have observed the same response

The congruency of aspects of Rife's research with homeopathy

Rather than dwell on the sustained and concerted effort by the AMA to destroy Rife, it is far more fruitful to explore his findings and their congruency with homeopathic principles, practice and experience:

Pleomorphism: Evolution of disease microorganisms

During 1932, Rife proposed that the cancerous cells he was observing exhibited 'pleomorphism'. This observation was later repudiated as

Royal Raymond Rife

© www.rife.org

fantasy by the mainstream. However, with the evolution of electronic scanning systems it has become accepted as conventional wisdom since 1950, yet no credit is given to Rife.

Upon removal of living diseased cells from laboratory animals Rife, using ultra high magnification, observed that these microorganisms evolved and mutated during the progress of an illness. Rife was able to watch, in real time, viruses as they altered form, accommodating to surrounding biochemical changes and replicating rapidly in response to carcinogens, transforming normal cells into tumour cells. Needing a descriptive name for this previously undiscovered phenomenon, he created the label: 'pleomorphism'. Those who rejected his observations had microscopes of only 2500 power magnification and thus were unable to see what Rife had witnessed.

Coordinated resonance: Applying the simillimum

Rife also observed that each type and stage of diseased cells emitted its own characteristic colour; that is, specific electromagnetic frequency unique to those observed cells. He coined the term 'coordinated resonance' for his method of targeting destruction of cells with intense pulses of the identical frequency pattern.

In homeopathy 'pleomorphism' and 'coordinated resonance' are acknowledged by the fact that different remedies are required as an illness or disease proceeds through the changing symptom phases of its cycle.

Toxic reaction: The homeopathic aggravation

Despite only stimulating diseased laboratory animals or human

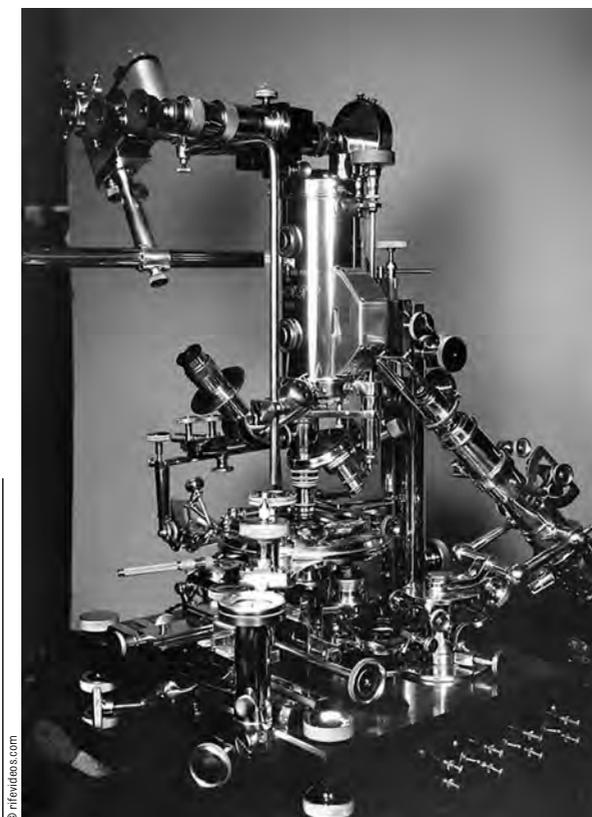

patients with a one-millisecond simillimum frequency pulse, excessive aggravation became an issue for Rife. To prevent the overloading of the body with the dead debris from tumour and pathogens, he found that by spacing the timing to one pulse every three days, the body was more readily able to process and excrete the toxic load without serious aggravation.

Homeopaths over the past 200 years have observed the same response when the body engages in toxic discharge. This means that potency and frequency of medication are an important consideration when prescribing.

Allopathic homeopathy: The simillimum for the pathogen!

Despite Rife's validating several homeopathic principles and findings, he also remains the ultimate allopath in that he focused on the outer manifestation of disease, namely pathogens. However, his approach would have guided medicine in a direction away from chemicals toward energy. Had his non-suppressive electromagnetic methodology become mainstream, allopathy would, today, be many steps closer to recognising that treatment of illness needs to be approached with regard to inner cause rather than mere removal of its bugs and external symptoms. How many billions of pounds and dollars would Rife's frequency-based treatment have saved throughout the world over the past 80 years? However, most importantly, how much suffering from radiation, chemotherapy, and drug poisoning would have been prevented or minimised?

In order to find the precise simillimum required to target and annihilate the various pathogens under

© rifeideas.com

investigation, Rife carried out tens of thousands of experimental procedures. Finding the colour emitted by the pathogen provided him with only an approximate corresponding frequency with which to zap it, for there are an infinite number of gradations along the electromagnetic spectrum, depending on the sensitivity of the instrumentation. To deal with this, he observed the effect of a trial zap of that frequency on the specimen and noted the response. Then, by tedious trial and error, raising and lowering the frequency by infinitesimal increments from that reference point and observing each response, he located the simillimum frequency that produced the most rapid resonant destructive result.

The challenge to reproduce Rife quality results today

Today, many would like to utilise the frequencies established by Rife during the 1930s. However, as pathogens evolve and mutate, their DNA electro-magnetic frequency emission evolves as well. New frequencies need to be established, but a frequency instrument of Rife's original simillimum transmission quality has yet to come into production.

Instead, in the USA and elsewhere, pulsed frequency devices

Rife's universal microscope

and frequency rate charts are currently being sold and utilised in naturopathic clinical practice as an adjunct to flower remedy therapy, acupuncture, homeopathy and other complementary therapies. These are akin to providing the equivalent of 'homeopathic similars' of varying degrees rather than the precise 'simillimum' treatments. This means there is a wide range of response to treatment with them. At the same time, it should be kept in mind that many rigorous individuals are attempting to precisely replicate the instrumentation and effects achieved by Rife.

Thus one may divide those with medical interest in the legacy of Rife into two main groups – those few who truly wish to replicate his achievements and those that choose to utilise pulsed electro-magnetic stimulation as complementary to other forms of treatment. The challenge for those who are attempting

Rife's approach would have guided medicine in a direction away from chemicals toward energy

➤ to consistently replicate Rife's achievement is to reproduce the complex base frequency emission from an electrified helium plasma tube while, at the same time, modulating (that is, manipulating) the resulting emission by several interactive radio frequency patterns.

You can draw an analogy to this interactive 'electronic soup' with the mixing of paint. Suppose you wish to mix your own paint. One begins with a base colour and then modifies it by adding small quantities of other tints to achieve the desired resultant colour. Now, suppose you keep no record of the quantity of base colour or even a note of the quantity of all the tints that have been added. This circumstance will place you in the position of the technical wizards who are genuinely attempting to create frequencies that will match the same quality and consistent results achieved by Rife. To merely reproduce a frequency with a simple frequency generator is not adequate. Although not visible to the eye, electromagnetic signals have 'shape' and it is essential to produce a signal shape that will, under intense pressure (that is, voltage), shatter the pathogen. Rife likened the process to that of an opera singer shattering a crystal goblet with a resonant high note.

The question has been raised: Why are we not all free of disease, as the environment around us is filled with sound, radio waves, television frequencies, WiFi, micro waves, radar frequencies, mobile phone frequencies and so on? The response has been that unless the unique electromagnetic shape is produced, healing from such cures will only be a random effect. This is similar to the proposition humorously made by homeopaths and non-homeopaths alike: Why not make a universal remedy by mixing all the remedies listed in the materia medica together and prescribing it any time someone falls ill? After all, one of them should be the simillimum?

The legacy of Royal Raymond Rife

Fortunately, not quite all of the records, data and instrumentation of the Rife era were confiscated, destroyed, stolen or incinerated. Much of the now saved materials were carefully preserved by one of Rife's assistants of the latter years of his life. As a result, one ultra

high power optical prismatic microscope remains intact. There are even some voice recordings of Rife along with notes, records, photographs and newspaper clippings.

However, in the annals of scientific journals and other academic records, there is no mention of Rife or his many masterful accomplishments. If one focuses away from the sordid sad story of Rife's treatment and life after 1938 in the way he was treated by the AMA, the medical fraternity and the government, there is an unacknowledged elephant in the room. That elephant is the aversion of the medical-scientific drug industry to even sniff a suggestive whiff or hint of homeopathic type practice, even if the 'H' word is never even articulated.

Over the years there has been serious investigation of the emission of light frequencies from cells and DNA. A summary and history of this ongoing effort can be found in: *Biophotons – The Light in Our Cells* by Marco Bischof, published in 1995 and available only in German, though now in its 9th edition. A summary of its contents appears on the website listed in the references below. Despite evidence to demonstrate the quantum-like coordinated and coherent emission

In the annals of scientific journals and other academic records, there is no mention of Rife or his many masterful accomplishments

Had the principles of Rife's contributions been integrated into Western medicine, the medical history of the last half of the 20th century would read very differently

of light and frequencies on the electromagnetic spectrum as an ongoing property of living cells, mainstream science prefers to adhere to a chemical explanation. In this model, the bioluminescence of cells is explained away merely as the random product of energy releases by excitation occurring in the chemical function of cells.

Even today the medical industry remains embedded in the chemical orientation of the 19th century. It has yet to seriously take on board the quantum-based physics of the 20th century. Biophotonic and biomagnetic medical treatment would significantly affect and reduce the worldwide sales by drug cartels. There are far more profits to be made from patenting and prescribing drugs, many of which are toxic and iatrogenic. As such the innovation by an ardent researcher-innovator of disease treatment with an instrument that, when assembled and made operative, would treat hundreds if not thousands of patients without replacement is a non-starter. If that device also demonstrates homeopathic principles in operation, even on an allopathic basis, the threat is sensed as keenly as if it were blood at two miles distance by a killer shark. The shark does not think or articulate about what it has sensed; rather, it devours it.

The medical industry remains embedded in the chemical orientation of the 19th century

You can draw another analogy for this unarticulated group action by the medical industry. When a substitute teacher is assigned to take over a class of high school students, without any overt verbal communication between them the class members will many times act in unison, seeking to disrupt the substitute teacher's attempts to carry on a learning dynamic.

We have then a repetitive saga of circumstances that are similar in

pattern to the experiences of Nicholas Tesla, Royal Rife, Wilhelm Reich, Jacques Benveniste, and now Luc Montagnier: they were all passionate pioneers who received recognition for innovation in the early days of their research but then were faced with repudiation at the end. Had the principles of Rife's contributions been integrated into Western medicine, the medical history of the last half of the 20th century would read very

The medical industry is like a shark

differently. Instead, they became the road not travelled!
